

# Stink Studios Website Fixes

## 1. Missing Benefit and Missing Title Font

**Careers Page.** The carousel is designed to use three items, but it seems that the first icon has been lost. The font for "Global benefits" hasn't been set, it defaults to Times New Roman.

## 2. Missing SVG Icon, Unnecessary Selectable Text

**About Page.** FWA icon is missing because the width and height CSS hasn't been set, when this is fixed it unfortunately loads with the wrong fill colour, shown on the right.

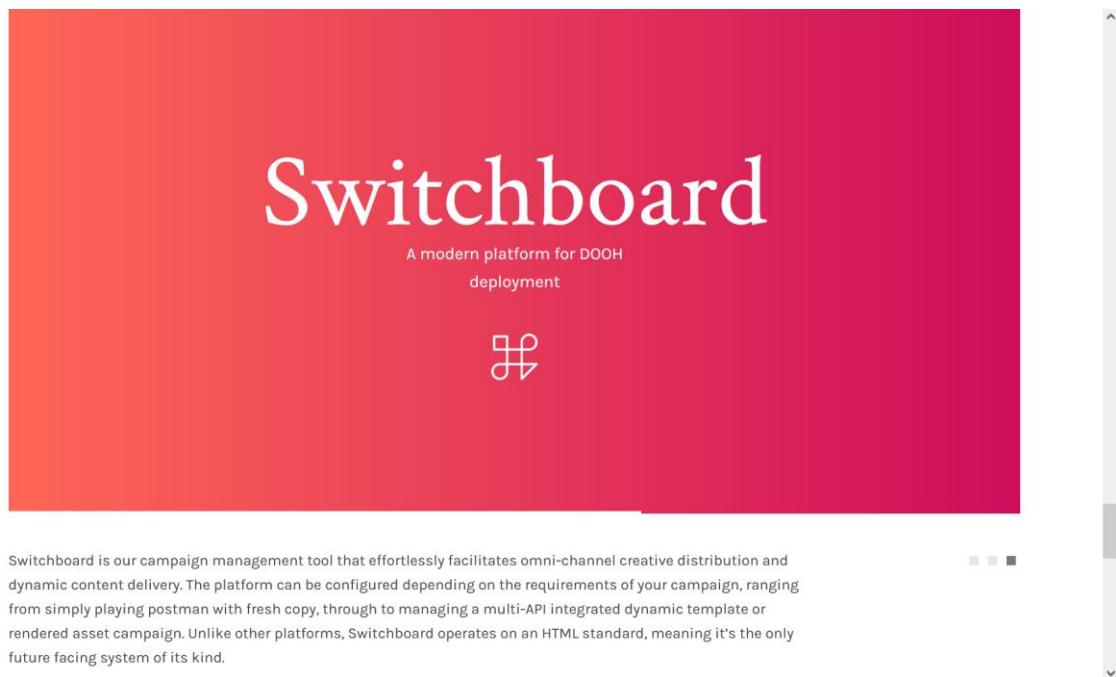

Clicking on any of these award numbers to try and learn more about the awards received highlights the text, creating the visual effect shown on the left image; the highlight flickers in and out on hover due to the pseudo-elements rising and falling in front of the SVG. Consider using `user-select: none;` to prevent this.

### 3. Photo Quality

**About Page.** It looks like Mark needs a new photo as his image is blurry and cropped incorrectly. All the other images load fine for this section.

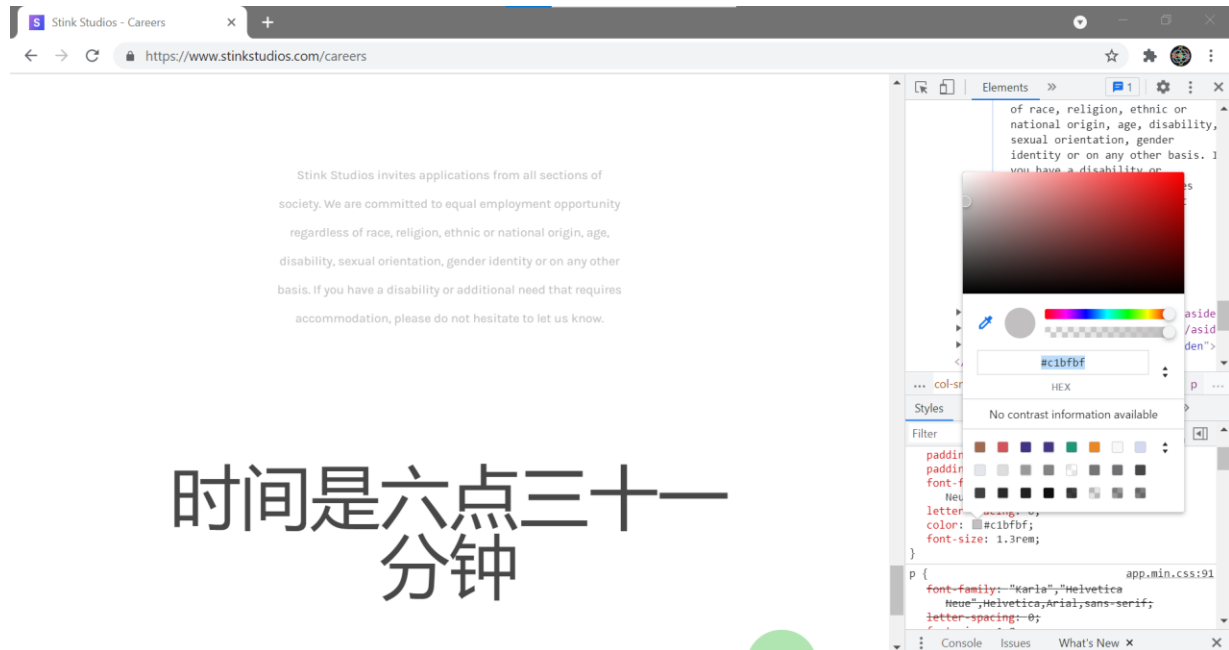

### 4. Product Carousel Text

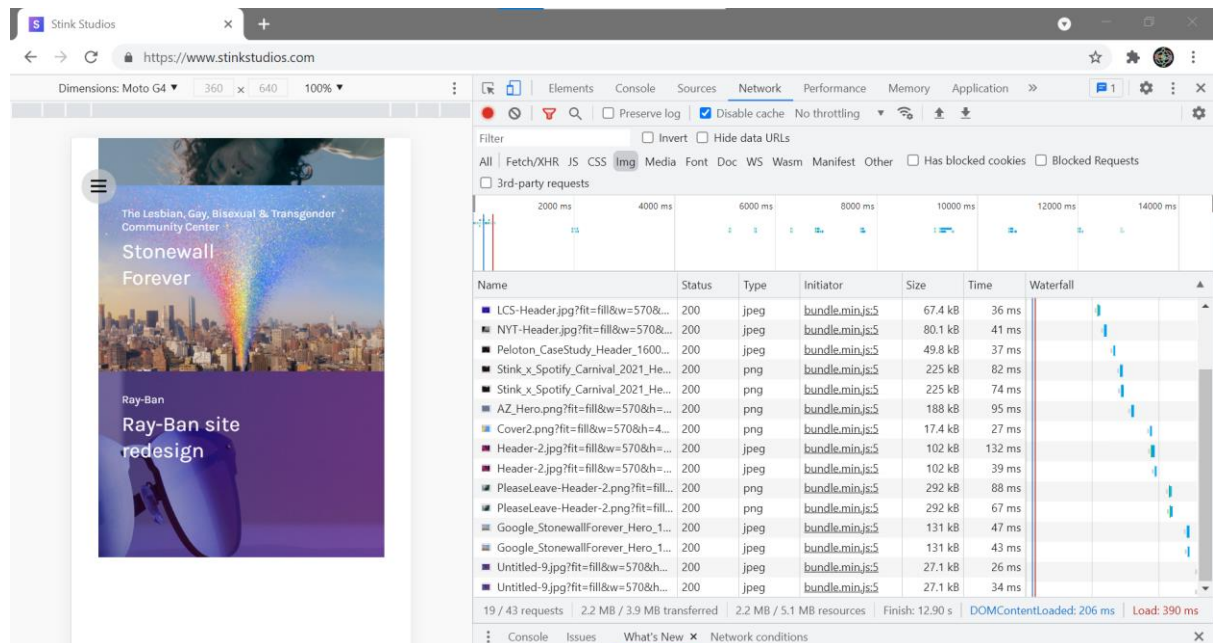

**About Page.** The automatic carousel moves too fast to read the text comfortably. Consider either a button to pause the carousel, lengthening the reading time, or shortening the Switchboard pitch.

## 5. Web Contrast Accessibility Concerns

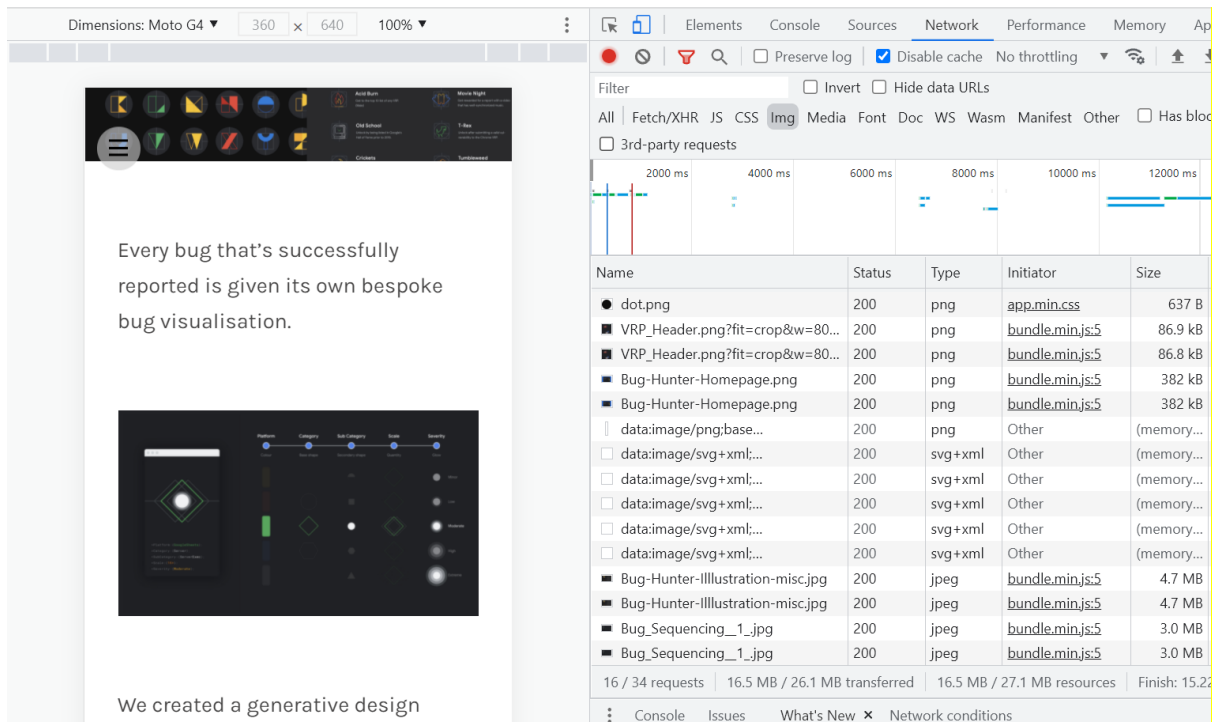

**Site wide.** The open invitation encouragement is quite difficult to read, written in small font and in a low contrast colour. It fails to meet WCAG AA or AAA standards, with a contrast ratio of 1.8 to the expected minimum 4.5.

## 6. All Images are Loaded Twice

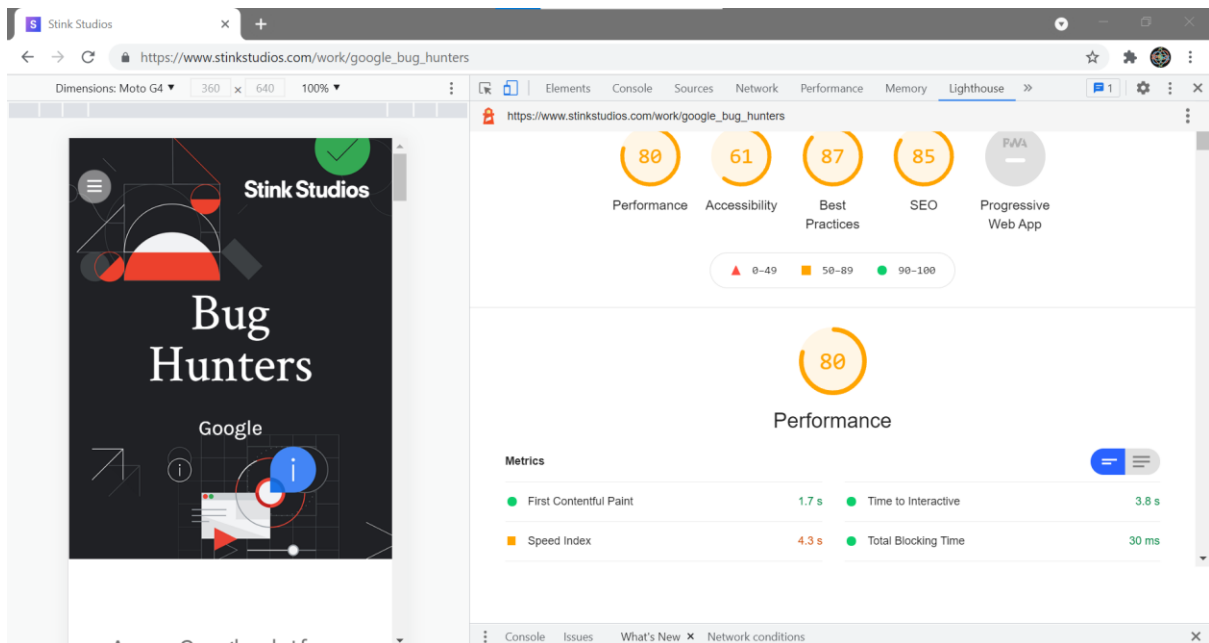

**Site wide.** You could save 1.1MB of mobile data if the images on your homepage were only loaded once. Images throughout the site are generally sized appropriately, however two images for your most recent project, the Google Bug Hunters program, have not been resized. Because they load twice, they take over 15MB worth of data to load from mobile users.

It's also difficult to see website detail in these images on mobile, consider cropping them or providing a way to enlarge them.

## 7. Lighthouse Considerations

**Site wide.** Lighthouse is generally useful check-up for how a webpage is performing. The accessibility section brings up contrast ratio issues noted earlier, there are also some security issues with incorrectly labelled external links in the social media section, a missing image alt text and a missing metadata description tag.
